

AUTOMATED NUTRITION SYSTEM WITH RPA AND AI

Adrian Nasrat
Anna Backolars
Linn Bellskog
Madde Stenberg

INTRODUCTION

Automatically optimize watering and nutrient supply for plants.

Detection of disease/pest infestation at an early stage.

Data-driven decision-making improves yield and resource efficiency.

Reduces waste

Reduces the spread of disease/pests

Optimum use of water and fertiliser

RPA'S ROLE IN THE SYSTEM

Automated measurement and data recording.

Decision-making based on analysis of data.

Automatic report generation and alerts

Real-time alerts and status updates.

Feedback loop between user and system

Integration with sensors and irrigation systems

FLOWCHART

WHAT CAN'T BE AUTOMATED?

Installation of the system

Maintenance and repair of the system

Control pests and diseases

Remove damaged plants

Fill the container with nutrients, sulfur and lime

THE HUMAN INTERACT WITH RPA

RPA-TOOLS

Sensor integration: Arduino/Raspberry Pi, IoT-protokoll (MQTT, LoRa)

RPA for automation: UiPath, Automation Anywhere, Python-bots

AI/Machine Learning: TensorFlow/PyTorch for reinforcement learning

Image recognition: OpenCV to analyze diseases

Database: SQL for managing data
