

Our business and main objectives

NLS provides a digital learning platform where students can access courses, quizzes and feedback, and where teachers and managers can follow progress and get insights.

The platform is used both in formal education and for corporate training.

The main business objectives are twofold. First, to improve learning outcomes for students by using AI and learning analytics. Second, to increase revenue by expanding into the corporate training market and offering attractive subscription models.

To support these goals, NLS focuses on personalized learning experiences, a scalable cloud-based platform and data driven decision making for both educators and management.”

Stakeholders and internal drivers

In our analysis we identified several important stakeholder groups.

The primary ones are students, who are directly affected by the AI recommendations, teachers who create and manage course material, and administrators who handle accounts, licenses and policies.

Inside the company we also have management, developers, IT architects, the Data and Analytics team, customer support and a Data Protection Officer.

Management cares about strategy and profitability, while the technical teams are responsible for building and running the platform. The DPO ensures that the system is compliant with GDPR.

The main internal drivers are the ambition to build a competitive AI module in the EdTech market, to improve scalability and technical stability, and to increase customer satisfaction and retention.

NLS also wants to reduce manual work through better data management and to support an innovative, learning oriented culture inside the organization.”

External drivers

NLS is also strongly influenced by external drivers. One of the most important is the digitalisation of education. Schools and companies expect modern e learning solutions, remote access and good analytics.

At the same time there is intense competition from global EdTech providers, which pushes NLS to continuously improve both functionality and user experience.

Regulation is another key driver. NLS has to comply with GDPR and national education rules, which affects how data is collected, stored and processed.

Finally, there is a growing demand for personalized learning and for systems that can integrate with existing tools such as learning management systems and single sign on solutions. This means that NLS must both offer AI based personalization and be able to connect easily to other platforms.
